Lab 4 AI Chat History

Space Invaders Vibe Coding | Lab-specific exchange and work record

This export records the lab-related user requests and assistant updates from this Codex session, followed by a factual summary of the implementation. It does not invent earlier prompts or claim to reproduce unrelated conversation content.

Conversation

Student	"Space invaders is lab 4."
Student	"wdymm repo, just finish it"
Codex	I will audit the repo against the handouts and complete missing submission pieces.
Codex	The audit found Lab 4 still had the baseline skipped-collision bug and lacked the requested game-over screen, replay difficulty selection, sound effects, gameplay videos, and chat-history export.
Codex	I am completing the game features and creating before/after clips that reproduce the bug and demonstrate the fixes.

AI-assisted work completed

The collision loop now iterates over a stable bullet snapshot and removes consumed bullets after collision checks. The game draws an in-window final-score screen, supports replay at Easy, Medium, or Hard difficulty, and plays packaged firing, enemy-hit, and game-over effects. The audio setup degrades gracefully when no sound device is available.

The before clip pauses on the baseline collision frame: removing one hit bullet from the list skips the next bullet for that collision pass, so the score temporarily shows one hit instead of two. The next update eventually registers the delayed hit. The after clip demonstrates both hits registering on the same update, the final-score screen, and restarting on Hard. These are scripted captures of the Pygame render output; the video evidence is not a screen recording of a person using the keyboard.
